- Let us see in detail these changes and our final proposal, based on our experience.

Evolution

Introduction

Non-credits
system

Credits
system

Bologna
Process

In Spain ...

- Until 90s, we had a system which was not based on credits.
- From the middle of the nineties all the studies started with a new system based on credits. This implied a total change of the Syllabus of all the studies in Spain.
- From 2010 all the studies are according to the Bologna Process. Again this implies a change of the Syllabus.
- We will study the influence of these changes in the teaching of Statistics for non-mathematicians.
- Along this presentation, we will consider, as an example, the case of Statistics for Engineering.

Statistics for Engineering

Bologna
Process

- Until 2001, the Syllabus of Statistics for Engineering established 120 hours of statistical lessons.
- That means 4 hours a week during all the academic year (**3rd year**) or, equivalently, 8 hours a week during one semester.
- All of them were in the classical classroom: 2 hours with theory and 2 hours solving problems in the blackboard.
- No lessons with computers.
- The content was mainly based on the theoretical aspect of the Statistics: Cramer-Rao bound, convergence in probability, etc.

Content

Introduction

Non-credits
system

Credits
system

Bologna
Process

1. PROBABILITY MODELS: Sample Spaces, Events and Set Operations; Probability: Definition, Axioms and Properties; Probabilistic Space; Discrete Sample Space; Conditional Probability; Bayes Theorem.
2. UNIDIMENSIONAL RANDOM VARIABLES: Concept, Operations and Properties; Distribution Function; Discrete and Continuous Random Variables; Characteristics of a Random Variable.
3. REMARKABLE DISTRIBUTION MODELS: Bernouilli; Binomial; Geometric; Negative Binomial; Hypergeometric; Poisson; Uniform; Gamma; Beta; Normal; Weibull.
4. N-DIMENSIONAL RANDOM VARIABLES: Concept; Classification (Discrete and Continuous); Distribution Function; Marginal and Conditional Distributions; Independence of Random Variables; Functions of Random Variables: distribution of the sum, product and quotient; Moments of the function of random vectors.

Content

introduction

Non-credits
system

Credits
system

Bologna
Process

5. **CONVERGENCE OF RANDOM VARIABLES:** **Moment-generating function**, Properties; **Types of Convergences**; **Weak Law of Large Numbers**; Central Limit Theorem.
6. **SAMPLING AND DESCRIPTIVE STATISTICS:** Sample and Population; Simple Random Sampling, Montecarlo Method; Graphic Representation of Data; Numerical Description of Data, Measures of Central Tendency and Dispersion; Sampling Distributions for Normal Populations; Fisher Theorem.
7. **POINT ESTIMATION:** Estimation; Properties of the Estimators (Unbiased, **Efficient**, **Sufficient** and **Consistent**); Methods of point estimation: the Method of Moments and the Method of Maximum Likelihood.

Content

Introduction

Non-credits
system

Credits

Bologna
Process

- From 2001 to 2009, the Syllabus of Statistics for Engineering established 75 hours of statistical lessons.
- That means 5 hours a week during one semester. **Almost the middle!**
- It was taught at the second academic year of the studies.
- Four of them were in the classical classroom: 3 hours with theory and 1 hour solving problems.
- One hour a week was in a computer room.

Kind of lesson	← 2001		2001→
Theoretical	4	⇒	3
Practical	4	⇒	1
With computers	0	⇒	1

Credits
system

Bologna
Process

- However the number of proofs in the classroom decreased a lot.
- Also some parts were explained with less detail. For example,
 - ▶ CHAPTER 4. DISCRETE AND CONTINUOUS DISTRIBUTION MODELS: Bernouilli; Binomial; Geometric; Negative Binomial; Hypergeometric; Poisson; Uniform; Gamma; Beta; Normal; Weibull.
- The practical lessons usually were not coordinated with the theoretical lessons.
- However, the content was still mainly based in the theoretical aspect of the Statistics. As an example:
 - ▶ CHAPTER 6. CONVERGENCE OF RANDOM VARIABLES: Types of Convergences; Chebychev Theorem; Weak Law of Large Numbers; Central Limit Theorem.

Assessment system

Introduction

Non-credits
system

Credits
system

Bologna
Process

- The final mark of this course will be based on the written official exam and the mark obtained at the practical sessions in the computer rooms.
- The written exam will be divided in two parts: a first theoretical part, formed by a test valued in four points and a second with exercises, valued in five points. In total, the **written exam** is valued with **9/10 points**.
- The **practical sessions in the computer rooms**, which will be compulsory in order to be allowed to do the written exam, will be valued with **1/10 points**.

Bologna Process

And them...Bologna arrives!!!

Introduction

Non-credits
system

Credits
system

Bologna
Process

- From 2010 any University Syllabus in Spain has to be adapted to the Bologna System.
- This supposed a new change of the Syllabus. Usually this implies a decreasing number of hours for Mathematics.
- In particular, the Syllabus of Statistics for Engineering established 60 hours of statistical lessons.

	← 2001		2001–2010		2010→
Nº hours	120	⇒	75	⇒	60

- That means 4 hours a week during one semester.

Just the middle that 9 years before!

Bologna System

Introduction

Non-credits
system

Credits
system

Bologna
Process

- Three hours a week are in the classical classroom: 2 hours with theory and 1 hour solving problems.
- One hour a week was in a computer room.

Kind of lesson	← 2001		2001–2010		2010→
Theoretical	4	⇒	3	⇒	2
Practical	4	⇒	1	⇒	1
With computers	0	⇒	1	⇒	1

- Moreover, it is taught at the second semester of the first academic year of the studies. Thus, the level of Mathematics is still very low for the students.

New purposes!!!

Introduction

Non-credits
system

Credits
system

Bologna
Process

- At that moment some of us consider we have the opportunity of a **total change in our methodology**.

New purposes!!!

Introduction

Non-credits
system

Credits
system

Bologna
Process

- Until 2001 (**Very high theoretical level!!!**):
 - ▶ The students had a good theoretical level.
 - ▶ Their practical abilities were really poor.
 - ▶ Most of them were not able to connect the subject with their profession.
- From 2001 until 2010 (**Neither high theoretical nor practical level!!!**):
 - ▶ The students had not a good theoretical level.
 - ▶ Their practical abilities were not realistic.
 - ▶ Besides that, the link between the theoretical and practical lessons was really unstable.
 - ▶ Some of them were able to connect the subject with their profession.
 - ▶ In fact, an elective course about Statistical Quality Control was the most elected, with more than 100 students (more than the double of the next one!!!).

New purposes from 2010!!!

- We hope the subject is **useful** to them **for solving real problems in their future jobs.**

- Everyone knows how to call by phone, but almost no one knows the theory of this process.
- We decided to use a similar system for teaching Statistics for No-Mathematicians.

New purposes from 2010!!!

Introduction

Non-credits
system

Credits
system

Bologna
Process

- We will sacrifice the theory in order to give the students high **practical abilities**.
- Any concept is introduced from an **intuitive point of view** and we devote our time to the ideas behind this concept and its practical use with the computer.
- Students participate all the time in the introduction of the new concepts and they deduce with the help of the teacher the utility and behaviour of any new concept.
- **Computer lessons are the main part of the subject**. Any other lessons can be considered as a preparation for these lessons.
- In computer lessons we consider a real data base and we use the concepts introduced in the “theoretical” lessons to analyse these data and obtain real conclusions using Statistics.

Assessment system

Introduction

Non-credits system

Credits system

Bologna Process

- The final mark of this course will be based on the written official exam and the mark obtained at the practical sessions in the computer rooms.
- The written exam is based on ideas and analysis of the results obtained by the computer. Students have not to developept the theory any time. Only to understand the concept and to know its applicability. The **written exam** is valued with **7/10 points**.
- The **practical sessions in the computer rooms**, which will not be compulsory in order to be allowed to do the written exam, will be valued with **3/10 points**.

COMPUTER LESSONS	2001–2010		2010→
Valuation	1	⇒	3
Attendance	Compulsory	⇒	Elective

Bologna
Process

KIND OF VARIABLE	FREQ. TABLE	USUAL GRAPHS	LOCATION MEASURES	DISP. MEAS.
Qualitative-Nominal (sex, machine, ...)	Yes	BarChart PieChart	Mode	
Qualitative-Ordinal (Studies level, ...)	Yes	BarChart PieChart	Mode Median Percentile	
Quantitative discrete (N° days, ...)	Yes	BarChart PieChart	Mode Mean Median Percentile	All
Quantitative continuous (Weight, ...)	No	Histogram Box-Plot	Mean Median Percentile	All

Methodology

Introduction

Non-credits
system

Credits
system

Bologna
Process

- Students obtain by themselves the definition of mean.
- They also arrive to its drawbacks:
 - ▶ Example 1: A grandfather has 4 grandchildren who are 4, 5, 6 and 30 years old. The mean is 11.25 years all. Is this a right central tendency measure?
 - ▶ Example 2: The mean salary in Spain in 2002 was 19808 euro by year. However a half of the Spaniards earned less than 15832 euro. Is the mean a right central tendency measure in this case?

Methodology

Introduction

Non-credits system

Credits system

Bologna Process

- We work with students with the idea of Median.
- We also present some examples where the median is not the best choice:

▶ Academic results:

Anne	
Mark	n ^o of credits
1	150
2	45
3	18
4	12

Susan	
Mark	n ^o of credits
1	180
2	36
3	9
4	0

- ▶ Anne is better than Susan, but the median is 1 in both cases.
- **Critical Thinking in Learning!!!**

Necessity of Measures of Dispersion

Introduction

Non-credits system

Credits system

Bologna Process

- Example 1: Two providers have an average of 10.3 days to provide the order. The number of working days used in the last orders was:

Who is our preference?

- Example 2: Hours devoted to study by four students.

	John	Anne	Emma	Paul
October	3	0	0	0
November	3	2	0	0
December	3	3	6	3
January	4	8	7	10

Who is more regular? And less?

- **Active participation of Students!!!**

Interpretations

Introduction

Histogram and Density Function

X =height; $n = n^0$ of women;

A =interval width

Introduction

Non-credits system

Credits system

Bologna Process

$n=50, A=1.67$

$n=200, A=1$

$N=2000, A=1$

$n \rightarrow \infty$

$A \rightarrow 0$

Histogram and Density Function

X =height; $n = n^{\circ}$ of women;

A =interval width

Introduction

Non-credits system

Credits system

Bologna Process

$n=50, A=1.67$

$n=200, A=1$

$N=2000, A=1$

$n \rightarrow \infty$

$A \rightarrow 0$

Idea of probability: continuous r.v.

Introduction

Non-credits system

Credits system

Bologna Process

área(■) = proporción de mujeres en la muestra cuya estatura está comprendida entre 150 y 155 cm.

área(■) = probabilidad de que, al elegir al azar una mujer, su estatura esté comprendida entre 150 y 155 cm.

- Density function: measures probabilities or “theoretical proportions”.
- When $n \rightarrow \infty$ and $A \rightarrow 0$, red area \approx green area.
(If the theoretical model describes properly the population.)

Probability of an interval from the density function

Introduction

Non-credits system

Credits system

Bologna Process

-Función de densidad
-El área bajo la curva vale 1

$$\int_{-\infty}^{\infty} f(t)dt = 1$$

-Función de densidad
-El área bajo la curva en un intervalo es la probabilidad del intervalo.

$$\int_{-\infty}^x f(t)dt = P(X \leq x) = F_X(x)$$

-Función de densidad
-El área bajo la curva en un intervalo es la probabilidad del intervalo.

$$\int_a^b f(t)dt = P(a < X < b) = P(a \leq X \leq b)$$

Methodology

- No integrals!
- We obtain any probability from the expression of the Distribution Function, since it is similar to the procedure used with a computer.

Example

The r.v. X has a **Weibull distribution** with parameters $k > 0$ (*shape*) and $\lambda > 0$ (*scale*), if its density function is:

$$f(x) = \begin{cases} \frac{k}{\lambda} \left(\frac{x}{\lambda}\right)^{k-1} e^{-\left(\frac{x}{\lambda}\right)^k} & \text{si } x \geq 0 \\ 0 & \text{si } x \leq 0. \end{cases}$$

Statistical Inference

Introduction

Non-credits
system

Credits
system

Bologna
Process

1. Introduction
2. Point Estimation
3. Interval Estimation
4. Statistical Hypothesis Testing

Necessity of the Statistical Inference

Is the volume of these bottle according to the specifications?

- The sample **ONLY** provides us information about the sample.
- For general conclusions (for all the population) the techniques of Statistical Inference are **NECESSARY**.

Introduction

Non-credits
system

Credits
system

Bologna
Process

Again ideas!!!

Introduction

Non-credits
system

Credits
system

Bologna
Process

- **Point estimation** of μ : $\bar{x} = 199.4$.
Error of estimation (unknown by the controllers): 0.4cm^3 .
- **Interval estimation** of μ : violet interval obtained from a sample of 100 bottles. Controllers have a high security (or confidence level) that μ is in this interval. But, they don't know the value of μ .
- **Hypothesis Testing** about μ : we conclude if μ can be equal to $\mu_0 = 200$.
From this sample, we decide don't reject this hypothesis.

Intpretation vs. manual development

Results of the one-sample test t

Estadísticos → Medias → Test t para una muestra

One Sample t-test

data: Acero\$consumo

$t = 3.8136$, $df = 116$, **p-value = 0.0002210**

alternative hypothesis: **true mean is not equal to 120**

95 percent confidence interval: 129.3516 149.5614

sample estimates: mean of x 139.4565

Studied tests

Introduction

Non-credits
system

Credits
system

Bologna
Process

- **Goodness-of-fit test.**
 - ▶ Shapiro-Wilk normality test
- **Central tendency measures.**
 - ▶ Test t for one sample (normal population)
 - ▶ Wilcoxon Test for one sample (NO normal pop.)
- **Proportion.**
- **Comparison of two proportions.**
- **Comparison of two dispersions.**
 - ▶ Test F (normal)
 - ▶ Levene Test (no normal)
- **Difference of central tendency measures.**
 - ▶ Test t for independent samples (normal, independence)
 - ▶ Equal variability
 - ▶ Non-equal variability
 - ▶ Test t for related data (normal, paired samples)
 - ▶ Wilcoxon Test for two samples (NO normal, independent samples)
 - ▶ Wilcoxon Test for paired samples (NO normal, paired samples)

Multivariate Analysis

Introduction

Non-credits
system

Credits
system

Bologna
Process

1. Relation between populations
 - ▶ Chi-Square Independence Test
 - ▶ Tests of Pearson's Correlation
2. Lineal Regression
 - ▶ Lineal Regression Models
 - ▶ Estimation of the parameters
 - ▶ Model Adequacy
 - ▶ Forecasting

Multivariate Analysis

Introduction

Non-credits
system

Credits
system

Bologna
Process

- They obtain the chi-square coefficient, the contingency coefficient and interpret the chi-square test of independence.
- They obtain covariance, the Pearson's product-moment correlation coefficient and interpret the p-value of the Pearson's correlation test
- They are able to do a complete simple linear regression analysis with real data (with residual analysis).
